my VIM Cheatsheet

Version 0.1

These shortcuts and descriptions are inspired by the awesome guide: Inserting text "Onramp to Vim"[4], an austrian talk script "Vim für Fortgeschrittene"[1] and at least the "Vim Reference Manual"[3]. Another good ressource for starting with Vim is the online Version of the vimtutor[2].

Motions (nouns)

Motions are in the sense of movement. See Vim's help page for motions for a full listing: :h motion

Moving within a line

h,	1		 	٠.		 ٠.	 	٠.	 ٠.					m	ove	e le	eft	$z/{ m ri}$	gh	t b	y	$_{\rm cha}$	ra	cter
W		 ٠.	 		 	 	 		 	 					m	ov	e	for	wa	$^{\mathrm{rd}}$	on	ie (\mathbf{w}	ord
b		 	 		 	 	 		 	 			m	ove	e t	0 ($(\mathbf{b}$)eg	ini	nin	g	of a	w	ord
е		 			 	 	 		 	m	ov	e	for	w	ard	l t	0	the	(€	e)n	d o	of a	w	ord

Jumping within a line

f <char> (f) ind a character forward in a line and move to it</char>
t <char> find a character forward in a line and move $un(t)$il it</char>
(one character before)
F <char> (f)ind a character backward in a line and move to it</char>
T <char> find a character backward in a line and move $un(t)$il it</char>
; repeat last f , t , F , or T command
, repeat last f, t, F, or T command, but in opposite direction

Moving between lines

j, k move up/down one line
$H, M, L \dots $ move (\mathbf{H}) igh, (\mathbf{M}) iddle, or (\mathbf{L}) ow within the viewport
/ search
$\tt n$ repeat last search - (n)ext
N repeat last search in opposite direction
$\langle \text{ctrl} \rangle u, \langle \text{ctrl} \rangle d \dots moves (u) p \text{ or } (d) \text{own half of a page}$
<nn>G (\mathbf{G})o to line number NN</nn>

a	(a)ppend text after the cursor
A	(a)ppend text at the end of the line
i	(i)nsert text before the cursor
Ι	(I)nsert text before the first non-blank in the line
0	(o)pen a new line below the current line, append text
	(O)pen a new line above the current line, append text

Text Objects (nouns)

Text objects allow you to run the command from anywhere inside the text object

For a full listing, see :h text-objects

\mathbf{w} ord

aw			(a)	(\mathbf{w}) ord,	includes	surrounding	white	space
iw		(i)nner	(\mathbf{w}) ord,	$does \underline{no}$	t include	surrounding	white	space
Ot	hers: [s	lil +						

Others. [4]11
s (s)entence
p (p)arapgraph
" "double quoted string"
) (parenthesized block)
t

Commands (verbs)

After pressing the key-mapping for a given command Vim will wait for you to identify the text you want the command to operate on. The simplest commands are made by simply repeating the operator a second time to act on the current line.

For example, where d is the operator for "delete", dd will delete the whole line. Each of yy, cc, >>, == behave similarly.

d													 																														(d	l)	el	e	tε	9	
С													 																													(c	:)	h	a	nį	ge	9	
																																												(
																																												y						
>,	4	<																																				iı	10	le	en	ıt	,	d	le	d	e	nt	t	
=							 							1	re	f	o	r	n	18	at	5	(:	re	ei	r	ıc	le	er	nt	t,	•	b	re	28	ık	ζ	lo	or	լջ	ς .	li	n	e	s,	•	et	С		

The Structure of an Editing Command (sentence)

<number><command><text object or motion>

Examples: Command + Motion

The following table shows some of the many variations of the delete operation you can build by combining the d operator mapping with a motion:

dw	\dots (d)elete from current position to the next (w)ord
de	\dots (d)elete to to the (e)nd of the <u>current</u> word
i2e	$\ldots \ldots \ldots$ (d)elete to to the (e)nd of the \underline{next} word
ij	(d)elete down a line (current and one below)
it)	\dots (d)elete forward un(t)il closing paranthesis
d/world	(d)elete up until the first search match for world
